About Natural Resources Wales

Natural Resources Wales is the organisation responsible for the work carried out by the three former organisations, the Countryside Council for Wales, Environment Agency Wales and Forestry Commission Wales. It is also responsible for some functions previously undertaken by Welsh Government.

Our purpose is to ensure that the natural resources of Wales are sustainably maintained, used and enhanced, now and in the future.

We work for the communities of Wales to protect people and their homes as much as possible from environmental incidents like flooding and pollution. We provide opportunities for people to learn, use and benefit from Wales' natural resources.

We work to support Wales' economy by enabling the sustainable use of natural resources to support jobs and enterprise. We help businesses and developers to understand and consider environmental limits when they make important decisions.

We work to maintain and improve the quality of the environment for everyone and we work towards making the environment and our natural resources more resilient to climate change and other pressures.

Evidence at Natural Resources Wales

Natural Resources Wales is an evidence based organisation. We seek to ensure that our strategy, decisions, operations and advice to Welsh Government and others are underpinned by sound and quality-assured evidence. We recognise that it is critically important to have a good understanding of our changing environment.

We will realise this vision by:

- Maintaining and developing the technical specialist skills of our staff;
- Securing our data and information;
- Having a well-resourced proactive programme of evidence work;
- Continuing to review and add to our evidence to ensure it is fit for the challenges facing us; and
- Communicating our evidence in an open and transparent way.

This Evidence Report series serves as a record of work carried out or commissioned by Natural Resources Wales. It also helps us to share and promote use of our evidence by others and develop future collaborations. However, the views and recommendations presented in this report are not necessarily those of NRW and should, therefore, not be attributed to NRW.

Crynodeb Gweithredol

Mae Cyfarwyddeb Cynefinoedd yn cyfleo y dylai rheolaeth o Ardaloedd Cadwraeth Arbennig (ACA) ceisio cyflawni'r **statws cadwraethol ffafriol** o nodweddion cynefinoedd a rhywogaethau a restrir yn ei Atodiad 1 ac Atodiad 11. Mae'n ofynnol i Cyfoeth Naturiol Cymru (CNC) i gyflwyno gwybodaeth yn rheolaidd am statws cadwraeth ffafriol nodweddion safle ar gyfer pob Ardal Cadwraeth Arbennig yng Nghymru. I wneud hyn, mae CNC wedi datblygu rhaglen o **fonitro cyflwr nodwedd**. Mae CNC wedi pennu cytundeb gyda Aquatic Survey & Monitoring Ltd. (ASML) i ddatblygu a rheoli'r rhaglen ar gyfer nodweddion rhynglanwol yr ACA ar gyfer cyfnod 2007 i 2019, drwy weithio fel tîm gyda staff CNC.

Mae ACA Pen Llyn a'r Sarnau wedi cael ei ddynodi ar gyfer pum cynefin Atodiad 1 a phedwar o rhai is. Prif nodweddion diddordeb rhynglanwol yw *Aberoedd* a'u gwastadeddau llaid, gwastadeddau tywod a riffiau cyfansoddol, Cilfachau eang bas a baeau gyda gwelyau *Zostera*, poblogaethau o *Pectenogammarus* deudroediog sy'n byw yn y graen, pidogau mewn clai a chymunedau o glogfeini is y lan a Riffiau, yn arbennig riffiau biogenig o *Sabellaria alveolata*. Ardaloedd o ddiddordeb penodol ar gyfer yr adroddiad hwn yw gwaddodion rhynglanwol ac ardaloedd creigiog ym Mae Tremadog, a phoblogaethau *Pectenogammarus* ym Mhwllheli. Mae'r adroddiad hwn yn disgrifi'r arolygon a gynhalwyd yn yr ardaloedd hynny ym mis Awst 2014.

Yn 2014 fe ddarganfuwyd fod yr ardaloedd o lyngyren ddiliau *Sabellaria alveolata* riff yn Llandanwg a Gorllewin Afon Dwyfor wedi gostwng yn aruthrol, ar ôl cael ei effeithio gan stormydd yn ystod gaeaf 2013/2014. Fe effeithiwyd fwyaf ar Orllewin Afon Dwyfor gyda gostyngiad o 67% o'r ardal riff. Roedd y patrwm o fewn y rhywogaethau cysylltiedig ar y riffiau hefyd yn un oedd yn gostwng mewn niferoedd.

Canfuwyd fod yna niferoedd cymharol iach o *Pectenogammarus planicrurus* (berdys deudroediog sy'n byw yn y graen) yn y graen yn Marian-y-De ger Pwllheli o fewn y parth helaeth oedd yn cael ei fonitro ar y lan.

Fe samplwyd aber datblygiad Glaslyn/Dwyryd ac fe welwyd fod y cymunedau yn y gwaddodion yn isel mewn amrywiaeth. Fodd bynnag fe welwyd y niferoedd mwyaf o is-ddosbarthiadau ac unigolion yng nghanol aber y Dwyryd ac aber yr afon Glaslyn. Nid oedd yn syndod fod y gymuned hon yn frith o gregyn deuglawr, deudroediad a mwydod gwrychog spionid.

Ym Mhorth Oer, welwyd nifer iach o is-ddosbarthiadau yng nghwadradau monitro lleoliad penodedig yn 2014 fel yn 2013. Cofnodwyd pum deg chwech o is-ddosbarthiadau o gymharu â 51 yn 2013. Roedd sefyllfa llygad maharen ym Mhorth Oer wedi newid ychydig yn 2014, gyda gostyngiad sylweddol yn y dwysedd ar y lan uchaf, nodwedd y gellir ei briodoli o bosibl i ddwyster stormydd y gaeaf blaenorol. Bu dwysedd glannau isaf a chanolig yn gymharol sefydlog. Fe ostyngwyd maint y boblogaeth o lygad maharen bach yng nghanol y glannau.

Fe welwyd gostyngiad o 15-40% mewn gorchudd y gragen long ar dri uchder o'r glannau, sydd o bosibl yn atgyfnerthu theori effaith stormydd.

Mae monitro cymunedau gwaddod trawsluniau ar aber y Mawddach yn dangos bod mwd a thywod mwdlyd yn tueddu i gael eu rheoli gan fwydod gwrychog gwasgaredig, a chymunedau folysgaidd, tra bod y tywod symudol ar orsafoedd y lan isaf yn gymharol ddiffygol, gan ei fod yn agored i halltedd cyson cyfnewidiol a gwaddodion symudol, oherwydd ffrydiau llanw cryf dyddiol. Ni ymddengys fod unrhyw wahaniaethau sylweddol yn ystadegau'r cymunedau isfilodaidd nodwyd rhwng yr adegau samplu yn 2012 a 2014.

Executive Summary

The Habitats Directive establishes that the management of Special Areas of Conservation (SACs) should aim to achieve the **favourable conservation status** of habitat and species features listed within its Annex I and Annex II. For SACs in Wales, Natural Resources Wales (NRW) is required to report on a regular basis on favourable conservation status of site features. To do this, NRW has developed a programme of **feature condition monitoring**. Aquatic Survey & Monitoring Ltd. (ASML) have been contracted by NRW to develop and manage the monitoring programme for the intertidal features in marine SACs for the period 2007 to 2019; working as a team with NRW staff.

Pen Llyn a'r Sarnau SAC is designated for five Annex 1 habitats and four subsidiary ones. The major features of intertidal interest are *Estuaries* and their constituent mudflats, sandflats and reefs, *Large shallow inlets and bays* with intertidal *Zostera* beds, populations of the shingle-dwelling amphipod *Pectenogammarus*, piddocks in clay and lower shore boulder communities and *Reefs*, particularly biogenic reefs of *Sabellaria alveolata*. Specific areas of interest for this report are the intertidal sediments and rocky areas in Tremadog Bay, and the populations of *Pectenogammarus* at Pwllheli. This report describes surveys carried out in those areas in August 2014.

In 2014 the areas of honeycomb worm *Sabellaria alveolata* reef at both Llandanwg and West of Afon Dwyfor were found to have decreased dramatically, having apparently been affected by the winter storms of 2013/2014. The impact at West Afon Dwyfor was the most marked with a decrease in reef area of 67%. The pattern within the associated species on these reefs was also one of decreasing abundance.

Pectenogammarus planicrurus (a shingle dwelling amphipod shrimp) at Marian-Y-De near Pwllheli were found in relatively healthy numbers in the shingle within the extensive zone monitored on the shore.

The Glaslyn/Dwyryd estuary complex was sampled and the community in the sediment was found to be of low diversity. However the greatest number of taxa and individuals were found in the mid-estuary of the Dwyryd and mouth of the Glaslyn. This community was unsurprisingly dominated by bivalves, amphipods and spionid polychaete worms.

At Porth Oer, a healthy number of taxa were encountered in the fixed location monitoring quadrats in 2014 as in 2013. Fifty six taxa were recorded compared to 51 in 2013. The limpet population at Porth Oer had changed slightly in 2014, with a dramatic decrease in density in the upper shore, a feature possibly attributable to the intensity of the storms of the previous winter. The middle and lower shores' density remained relatively stable. In the middle shore the size classes of small limpets within the population were also reduced.

Barnacle cover at all three shore heights at Porth Oer showed a 15-40% decrease, possibly reinforcing the storm impact theory.

The sediment community monitoring transects on the Mawddach estuary show that the muds and muddy sands tend to be dominated by sparse polychaete, and molluscan communities, whilst the mobile sands of the lower shore stations are relatively depauperate, being exposed to constantly fluctuating salinity and mobile sediments, due to the strong tidal streams on a daily basis. There appear to be no significant differences in the infaunal community statistics noted between the sampling occasions of 2012 and 2014.

1. Introduction

1.1 Background

The Habitats Directive establishes that the management of Special Areas of Conservation (SACs) should aim to achieve the favourable conservation status of habitat and species features. In the case of SACs, the features are the habitats and/or species listed in Annex I and Annex II of the Habitats Directive for which the individual site has been selected.

The Natural Resources Wales (NRW) has a statutory duty to produce advice under Regulation 33 of the Habitats Regulations 1994, which states:

"As soon as possible after a site becomes a European marine site, [NRW / EN] shall advise other relevant authorities as to – the conservation objectives for that site, and any operations which may cause deterioration of natural habitats or ... disturbance of species, for which the site has been designated."

This Regulation 33 advice package is the foundation for feature condition monitoring, which is required in order for NRW to fulfil its function of reporting on whether features are in favourable conservation status. NRW staff are developing Regulation 33 packages and the associated performance indicators.

NRW developed a programme of intertidal monitoring work across Wales during 2004 and 2005. These surveys were managed and implemented for NRW by the Institute of Estuarine and Coastal Studies (IECS, University of Hull). These projects focused on a wide range of sensitive habitats such as *Zostera*, muddy gravels, caves, rock pools, algal dominated rocky shores, *Sabellaria* reefs, under-boulders, and various rare habitats and species.

Aquatic Survey & Monitoring Ltd. (ASML) have been contracted by NRW to continue development and management of the intertidal monitoring programme for each marine SAC for the period 2006 to 2019, working as a team with NRW HQ and NRW Regional staff.

1.2 Pen Llyn a'r Sarnau SAC

Pen Llyn a'r Sarnau SAC (Figure 1) is designated for five Annex 1 habitats and four subsidiary ones, listed in Table 1. Of these, estuaries and their constituent mudflats, sandflats and reefs, large shallow inlets and bays with intertidal *Zostera* beds, populations of the shingle-dwelling amphipod *Pectenogammarus*, piddocks in clay and lower shore boulder communities and Reefs, particularly biogenic reefs of *Sabellaria alveolata* are the main habitats of interest within the intertidal areas of the SAC. Conservation objectives for these habitats are given in the Regulation 33 advice for the SAC (CCW 2009).

Phase 1 surveys of intertidal habitats in the SAC were carried out between 1999 and 2003 (Brazier *et al.* 2007), providing detailed mapping of the intertidal biotopes with some information on characterising species. Previous data exists on the intertidal habitats and communities present at many sites in the SAC, particularly the Mawddach Estuary where monitoring trials as part of the LIFE programme were carried out in 1999 and 2000 (Mercer 1999; Sanderson *et al.* 2001).

The present report deals with features within Tremadog Bay, on the Llyn peninsula and the continued presence of a gravel-dwelling amphipod (*Pectenogammarus planicrurus*) at Pwllheli.

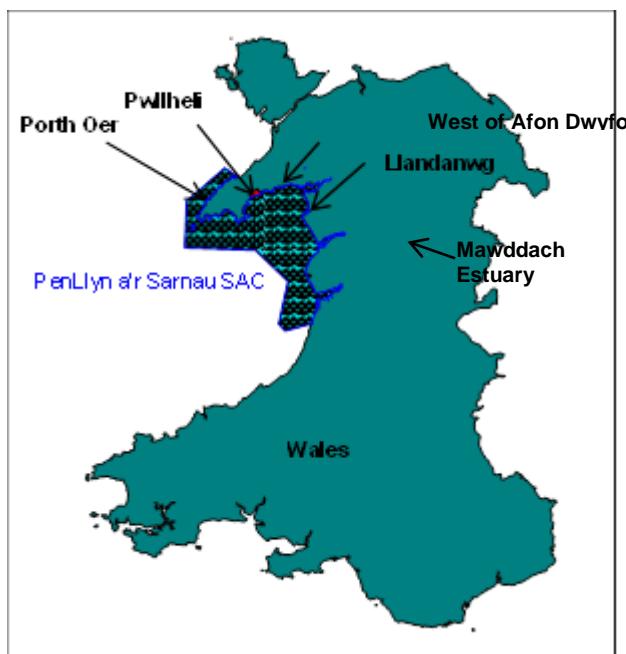

Figure 1 Pen Llyn a'r Sarnau SAC and work area. © Crown Copyright and database right 2016. Ordnance Survey. Licence number 100019741.

Table 1 Annex 1 habitats in Pen Llyn a'r Sarnau SAC

Annex I habitats that are a primary reason for selection of this site	Sandbanks which are slightly covered by sea water all the time
	Coastal lagoons
	Large shallow inlets and bays
	Reefs
	Estuaries
Annex I habitats present as a qualifying feature, but not a primary reason for selection of this site	Mudflats and sandflats not covered by seawater at low tide
	Salicornia and other annuals colonising mud and sand
	Atlantic salt meadows (<i>Glauco-Puccinellietalia maritimae</i>)
	Submerged or partially submerged sea caves

1.3 Estuaries

Pen Llyn a'r Sarnau has representative examples of bar-built estuaries in north-west Wales, and includes the Glaslyn/Dwyryd, Mawddach and Dyfi estuaries. There is a continuous gradient between the clean sands near the entrance to the sea and the mud or muddy sands in the sheltered extremes of the estuaries. The intertidal sandflats support communities of burrowing invertebrates, including dense populations of polychaete worms, crustaceans, bivalve molluscs and gastropod molluscs. Saltmarsh fringing the shores of the estuaries, and the saltmarsh creeks and pools, are important habitat features for juvenile fish (JNCC website).

All three estuarine systems in the SAC were visited by CCW staff during September 2006 to evaluate the likely impacts of the opening of the cockle fishery. Major channel changes in the Glaslyn/Dwyryd Estuary, apparently due to natural processes, meant that the main cockle bed had gone. The saltmarsh boundaries were broadly similar to those recorded by the 1997 intertidal survey in the area surveyed on the south side of the estuary (Morfa Harlech). NNR photo monitoring points were used to assess this. There was little change noted in the channel positions in the Mawddach and the cockle bed was still evident. There had however been an expansion of the *Salicornia* spp. boundary onto the mudflats by as much as 200m in the area surveyed (pers. comm. G. Wyn, CCW). The coverage of *Spartina* sp. remained similar to the 1997 boundary in the area surveyed. The cockle bed was in poor condition with few large cockles and extensive growths of algae. It was thought that this could be due to the hot summer. The boundaries of the higher saltmarsh in the Dyfi were broadly similar to those in 1997. *Salicornia* spp. encroachment in the area surveyed was up to 500 m in places (Pers comm., G. Wyn, CCW). The cockle bed was in poor condition with banks of cockle shells mixed in with live cockles.

It was concluded that there had been major changes in all three estuaries since the 1997 survey, with major changes in channel morphology in the Glaslyn/Dwyryd Estuary and encroachment of pioneer saltmarsh onto the mudflats in the Mawddach and Dyfi Estuaries. The reasons for these changes were not known but in the absence of any other evidence appeared to be due to natural fluctuations in water flow and temperature.

Proposals to construct a surfing reef at Borth, south of the Dyfi Estuary, and to improve the harbour facilities at Aberdyfi, including dredging, have created concerns for the integrity of the estuary.

1.4 Reefs

Intertidal reefs in Pen Llyn a'r Sarnau SAC include areas of bedrock and boulder/cobble habitats and many areas are characterised by biogenic reef formed by the honeycomb reef worm *Sabellaria alveolata*.

Surveys of intertidal habitats in the SAC were carried out in the SAC in 1996 and 2003 (Brazier *et al.* 2007), providing detailed mapping of the intertidal biotopes with some information on the characterising species.

Sabellaria reefs are designated as a Biodiversity Action Plan Habitat (c.f. www.ukbap.org.uk) and Nationally Important Biotopes (JNCC 1996). Surveys of *Sabellaria* reefs in the SAC were carried out for CCW in 2004 and 2005 (Boyes & Allen 2008) and in 2008, 2009, 2010, 2012 and 2013 (Mercer 2010a, b, Mercer 2011, Mercer 2013 and Mercer 2016).

1.5 Presence of *Pectenogammarus* at Pwllheli

Pectenogammarus planicrurus is the only amphipod which is a permanent resident of shingle beaches and it was found on the steep gravel/pebble beach fronting the Promenade at Pwllheli (LGS.Pec biotope) during Phase 1 surveys undertaken by CCW during June 1996. IECS was commissioned in 2004 to identify and map the presence and extent of *P. planicrurus* along the beach, establishing whether the amphipod was restricted to a localised habitat or was present along the entire length of Pwllheli beach. In addition, they estimated its abundance and took core samples for Particle Size Analysis (PSA) across the full extent of the biotope (Hemingway *et*

al. 2004). 61 stations were sampled and the amphipods were found to be present at 53 of these and abundant at 21 stations, using a SACFOR scale. The animals can be observed in the shingle in the lower half of the beach in the vicinity of the surf zone, when a small scrape reveals standing water. Further monitoring of the amphipod has been undertaken by ASML since 2007 (Howson *et al.* 2009; Mercer 2010a, b; Mercer 2011, Mercer 2013 and Mercer 2016).

1.6 Survey objectives

Table 2 Tasks selected by NRW for study by ASML in the SAC in 2014

Feature / attribute	Site(s)	Task
<i>Pectenogammarus</i> populations (LGS.Pec) - presence	Marian-y-de at Pwllheli	To monitor the population of this scarce 'shingle beach specific' amphipod species.
Intertidal Reef – quality	Porth Oer rocky shore	To re-survey the fixed monitoring quadrats in the upper, mid and lower shore stations at Porth Oer.
<i>Sabellaria alveolata</i> - distribution, quality and associated species	Llandanwg and West of Afon Dwyfor rocky shores.	To re-map the boundary of the <i>Sabellaria</i> reefs and to re-survey, with quadrats, the transects established and surveyed in 2009 - 2013.
Estuaries	Mawddach & Glaslyn/Dwyryd estuaries	To re-survey the sediment shore <i>in situ</i> and coring sites established in 1999 & 2008 respectively
Open coast	East Criccieth, Black Rock sands, Morfa Harlech and Morfa Dyffryn	To quantitatively sample the infauna of the middle and lower shore sediment biotopes

The survey of the *Pectenogammarus* populations (LGS.Pec) was intended primarily to confirm the continued presence of the species at Pwllheli whilst repeating work carried out by IECS in 2004 (Hemingway *et al.* 2004) and ASML in 2007 (Howson *et al.* 2009), 2008 (Mercer 2010a) and 2009 (Mercer 2010b). The *Sabellaria alveolata* work planned was to repeat the 2009, 2010, 2011, 2012 and 2013 quadrat work carried out by CCW/NRW and ASML at the two main sites in the SAC (Llandanwg and West of Afon Dwyfor). The intertidal reef work at Porth Oer aimed to re-survey the fixed quadrats on this rocky shore on the Llyn Peninsula, utilising the methods developed for the existing monitoring sites in the Pembrokeshire Coast SAC and Skomer Island Marine Protected Area. The Mawddach quantitative sediment sampling sites were established in 1999 and the work in 2014 repeated the coring exercise. Whilst the *in situ* grid sampling sediment work helped to re-map the channel positions on the Glaslyn / Dwyryd and the location of the littoral sediment biotopes within the sediments of the estuaries.

2 Methods

2.1 Survey planning, logistics and risk assessment

Development of a survey strategy and methodology for the 2014 tasks was carried out by ASML and NRW. Logistical planning for the 2014 survey was carried out by ASML and a draft Survey Plan and Risk Assessment was prepared and distributed to all the surveyors in advance of the survey. This plan once finalised included information on the survey location, personnel, work scope and plan, logistics, tide tables, potential hazards, assessment of risk from those hazards, actions/measures to minimise risk, contact details for emergency services, personnel and next of kin. The team was based at a house in Prenteg (Ty Glaslyn) near to Porthmadog. This house is located in an ideal location for work all over the PLAS SAC, the WiFi, off-road parking and spacious inside and outside accommodation proved again to be beneficial to the survey.

Field survey equipment was provided by both ASML and NRW; this included handheld GPS receivers (various makes and models, all set to British National Grid and OSGB36 datum), digital cameras (various makes and models, all set to high resolution and local time), gridded quadrats (various sizes), tape measures, first aid kits. Microscopes, identification guides, laptop computers, laser printer and other field laboratory equipment were also provided by both ASML and NRW. GIS mapping software (MapInfo), Microsoft Office software and various other utilities were used for daily survey planning, data entry, downloading GPS data and digital photographs and cataloguing files.

Field work was carried out during five days of spring tides, 10th to 14th August 2014, by a team of up to seven marine biological surveyors (see field log, Appendix 1). Weather conditions were fair for the week's survey work.

2.2 *Sabellaria* reef surveys

The modified Boyes & Allen (2008) methodology for *Sabellaria* monitoring was again used for the 2014 Pen Llyn a'r Sarnau SAC survey. A rationale for the modified methodology is given below. The proforma recording form used in the field is presented in Appendix 2.

2.2.1 Rationale

Extent and distribution of *Sabellaria* reef in Wales has clearly been increasing in recent years and this may be related to climate change. Monitoring both extent and overall condition at selected sites is therefore very relevant to SAC condition. The quadrat survey methodology developed for Pen Llyn a'r Sarnau SAC (Boyes & Allen 2008) and adapted by ASML in 2007, 2008 and 2009 provides good quality, repeatable data in a relatively short timescale. Hence these methods were considered appropriate in 2014.

Good condition of *Sabellaria* reef is listed as a Conservation Objective of the Pen Llyn a'r Sarnau SAC. The Performance Indicators recommended below are focussed on the value that the *Sabellaria* reef provides to the biological condition of the communities of fauna and flora. Mature *Sabellaria* reef tends to increase sub-habitat diversity (including abundance of overhangs, crevices, pools etc.) and consequently increases species diversity on the shore. However there is no simple correlation with age and condition of the reef. Measures of sub-habitat diversity

and/or species diversity may therefore provide information on the biological condition, but measures of the condition of the reef itself may provide information on its viability.

Many of the measures described in Boyes & Allen (2008) to record attributes in a 4 m² quadrat are very subjective and difficult to estimate with any accuracy or repeatability. Photographs are likely to provide better comparative information. Measures of species diversity were well defined, but protocols were adapted for the *Sabellaria* reef habitat. Quadrats provide the simplest repeatable recording unit, but fixed quadrats were not thought to be feasible, especially as much of the underlying boulder substratum is potentially mobile during rough weather. The best quadrat size for rapid deployment and recording, limiting the effects of small scale heterogeneity (in the typical large boulder/cobble habitats present) and for practical use in the field is considered to be 0.25 m² (0.5 m x 0.5 m). A larger size quadrat would be cumbersome in the large boulder habitat and larger quadrats are also known to be inefficiently searched. Due to the fragile nature of the habitat/biotope it is vitally important that the condition of the *Sabellaria alveolata* reefs are not being degraded by the act of monitoring itself, an issue that can occur in similar fragile biotopes.

2.2.2 Site and transect locations

The Llandanwg and West Afon Dwyfor *Sabellaria* reef transects were re-surveyed in 2014, having been surveyed by ASML in 2009, 2010, 2012 and 2013.

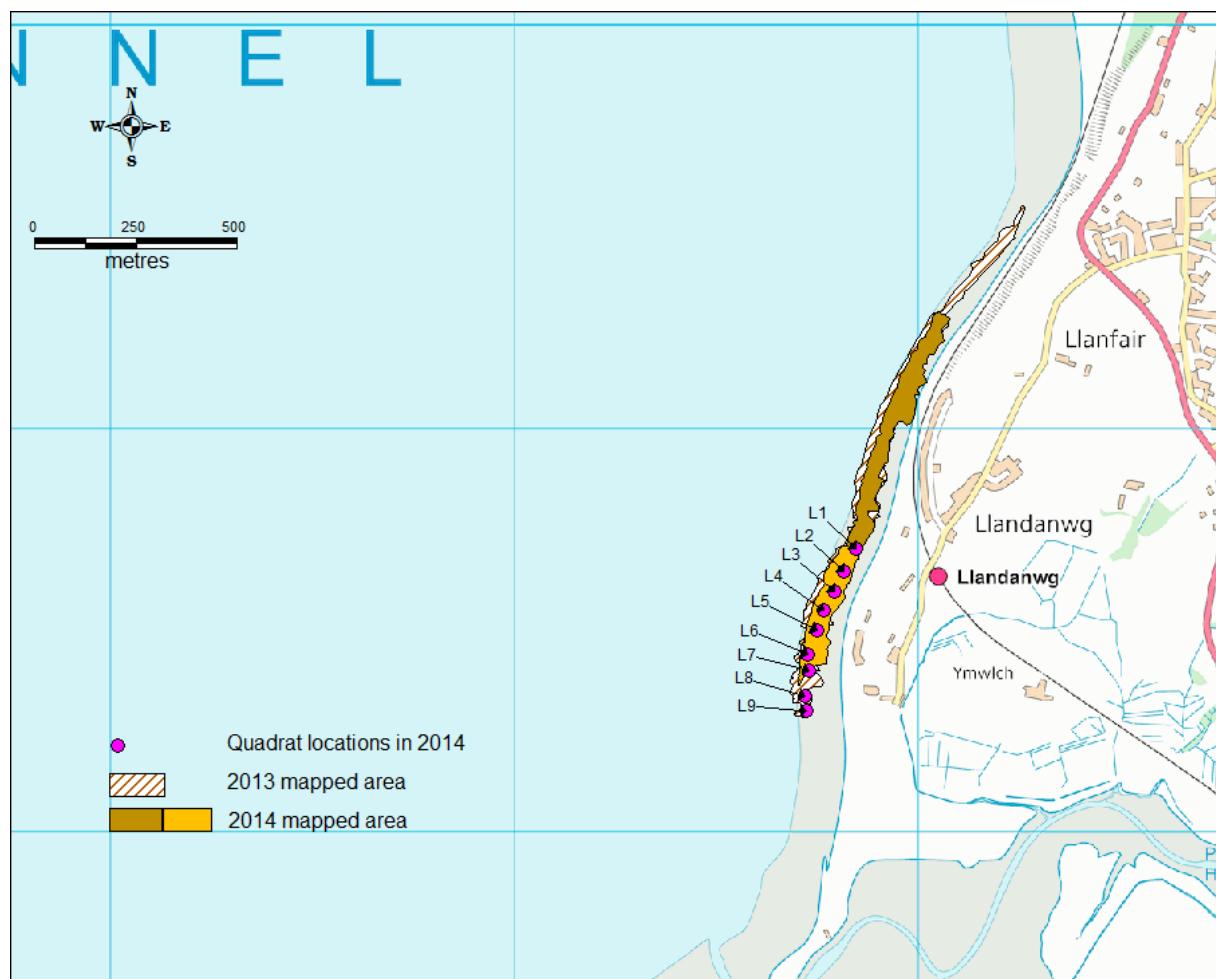

Figure 2 Location of the *Sabellaria alveolata* reef quadrat sites at Llandanwg. © Crown Copyright and database right 2016. Ordnance Survey. Licence number 100019741.

Existing 2013 maps of *Sabellaria* reef in these areas (originally using GIS data from CCW Phase 1 survey and IECS survey) were used to orientate the work area in 2014. At both Llandanwg and West Afon Dwyfor the survey task was to re-survey the areas surveyed by quadrat in 2009, 2010, 2012 and 2013. The *Sabellaria* reef in the vicinity of the quadrat sites was also mapped from the upper limit of *Sabellaria* on the shore, to the lower limit of access on the shore, as dictated by the height of the low tide. These mapped areas can be seen to be very similar to the 2013 areas, as can be seen in Figure 1Figure 2 and Figure 3. On the shore, the GPS receivers were used by the survey teams to navigate to the correct, central position for each survey area within the 'quadrat zone' described in 2009, within the *Sabellaria* reef.

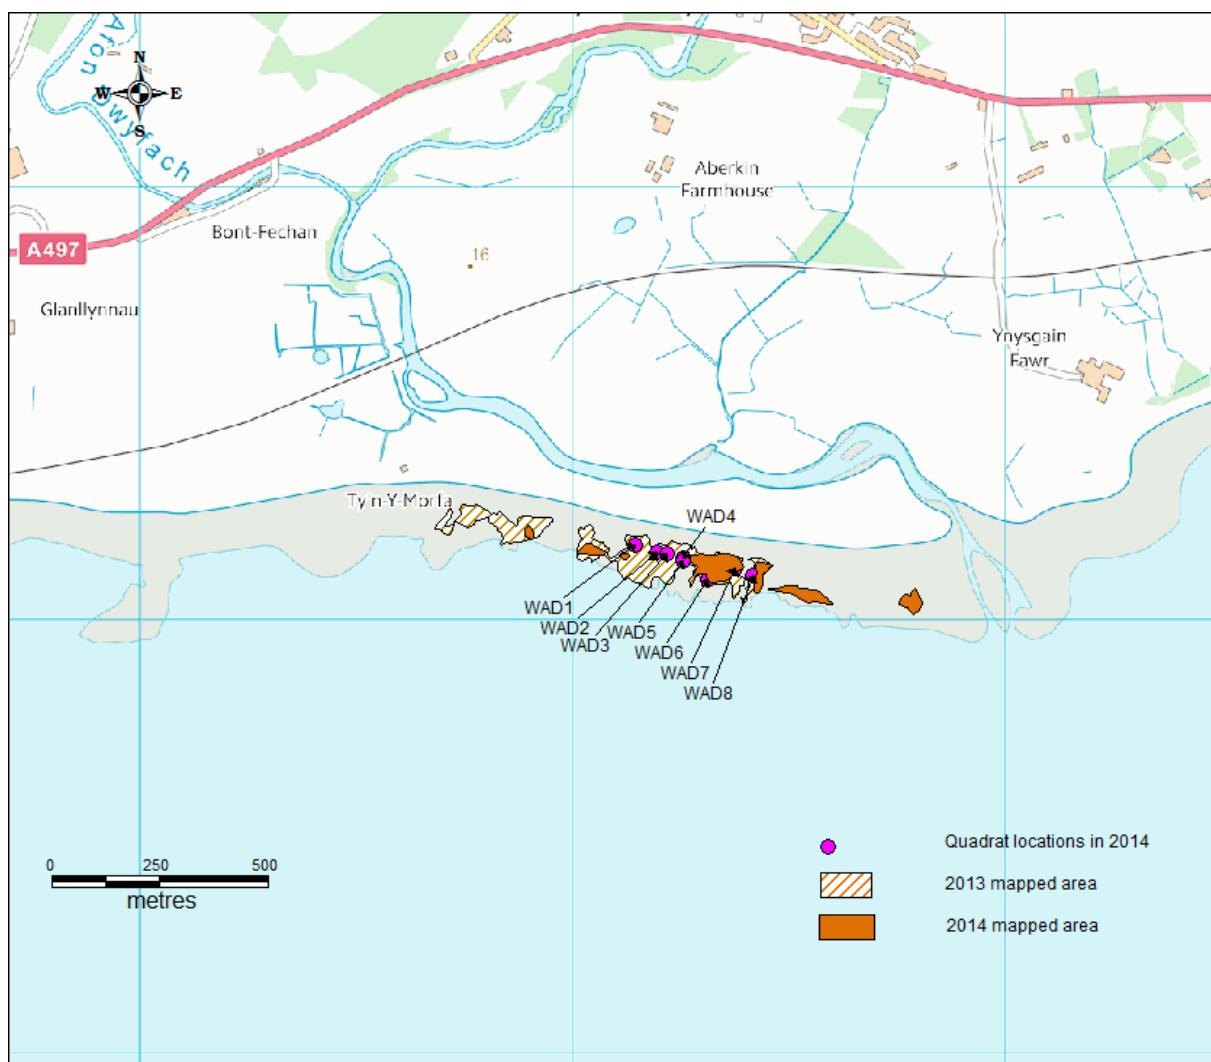

Figure 3 Location of the *Sabellaria alveolata* reef quadrat sites at West of Afon Dwyfor. © Crown Copyright and database right 2016. Ordnance Survey. Licence number 100019741.

2.2.3 Quadrat survey methods

At each quadrat station, surveyors established an origin at the centre of an imaginary 20 m x 20 m grid i.e. at co-ordinate location (10 m,10 m) (x,y) and then the surveyors proceeded to survey 15 random quadrats. 5 of these quadrats were surveyed in detail, recording some biotope properties and all species present. In the other 10 quadrats just the abundance of total *Sabellaria* reef and live *Sabellaria* reef were recorded. To minimise trampling, these 15 random positions were generated by

assigning a random x-value and random y-value using Microsoft Excel random number generator and these were converted into coordinates on a waterproof map of the grid. The co-ordinates were then surveyed on the 20 m x 20 m field grid travelling from one to the other by following the 'map' and not returning to the origin each time. Estimates were made of the percentage cover of standing water, total *Sabellaria*, live *Sabellaria* and a small selection of key species/taxa in each quadrat. Other typical fauna and flora (listed on the proforma) were then searched for and recorded. No estimation of abundance was required for these species (to speed up the recording), but rapid estimates of algal cover and some other major cover organisms such as *Mytilus edulis* were made. The presence of any other species that were seen and could be reliably identified *in situ* was then recorded in the blank rows available on the proforma (Appendix 2). Specimens of notable species that could not be reliably identified *in situ* were taken for laboratory identification (a field laboratory was set up in the accommodation). At each quadrat position, a gridded 0.25 m² quadrat (0.5 m x 0.5 m) was placed on the point of the surveyor's toe without them looking at the substratum. Digital photographs were taken of each detailed quadrat to illustrate habitat and condition of *Sabellaria* reef. The photographs were taken in plan-view, so that the quadrat filled the frame and the photograph number was recorded against quadrat number. The mapped *Sabellaria* reefs and quadrat stations at Llandanwg and West of Afon Dwyfor are shown in Figures 2 and 3.

2.2.4 Station locations

The surveyors used GPS receivers to navigate to the origin of each quadrat station on each transect. Field rucksacks were placed at this central position for easy orientation. Quadrat station positions for the 2014 *Sabellaria* reef surveys are presented in Table 3 below and the original transect locations (from 2009) are presented in Table 4 for continual reference only.

Table 3 Quadrat stations on the transects at Llandanwg and West of Afon Dwyfor, 10th and 11th August 2014

Sabellaria alveolata reef extent

The extent of the *Sabellaria* reef at Llandanwg and West of Afon Dwyfor were mapped in 2014 using the track function of handheld GPS units. In 2014 a large area

of the bed beyond the survey area at Llandanwg was mapped, as was the bed to the east of the quadrats at West of Afon Dwyfor because time allowed. In each case the methodology was standardised as described below.

The surveyor walked along the edge of the area with the GPS automatically recording a track fix every few seconds (typically 5 seconds). A '5 m rule' was applied – i.e. if a loop in the margin of the reef was more than 5 m across, it was walked around; but if it was less than 5 m it was ignored. It was also sometimes necessary to cross small gaps in the reef in order to include notable outlying patches. In places, quite large gaps were crossed, but the surveyor would then return to the main reef via the same access route and make a note with a waypoint to this effect.

Table 4 Full transect locations at Llandanwg and West of Afon Dwyfor for the transects surveyed in 2009 - presented for reference only

Full results of the *Sabellaria alveolata* surveys are presented in Appendix 3 (Llandanwg) and Appendix 4 (W of Afon Dwyfor).

2.3 *Pectenogammarus* surveys

Populations of the amphipod *Pectenogammarus planicrurus* are known to be present in intertidal shingle at Marian-y-de at Pwllheli. Visits were made to the site at 13:00hrs and 14.00hrs (2 hours before low water respectively) on 10th and 11th August 2014, to determine if populations of the amphipod were still thriving. The amphipods are found by locating the appropriate habitat (shingle) on the shore below mid tide level, making a small scrape in the shingle just above the surf zone, as the tide is falling and then looking for the amphipods swimming in the small pool of water created. This was repeated three times at each of the same two sites (P10 and P23) surveyed in 2007, 2008 and 2009, 2010, 2012 and 2013. In 2014 these sites were both re-surveyed along with a suite of further survey sites to the east and west. All sites surveyed in 2014 are shown in Figure 4 and the results are presented in section 3.2.

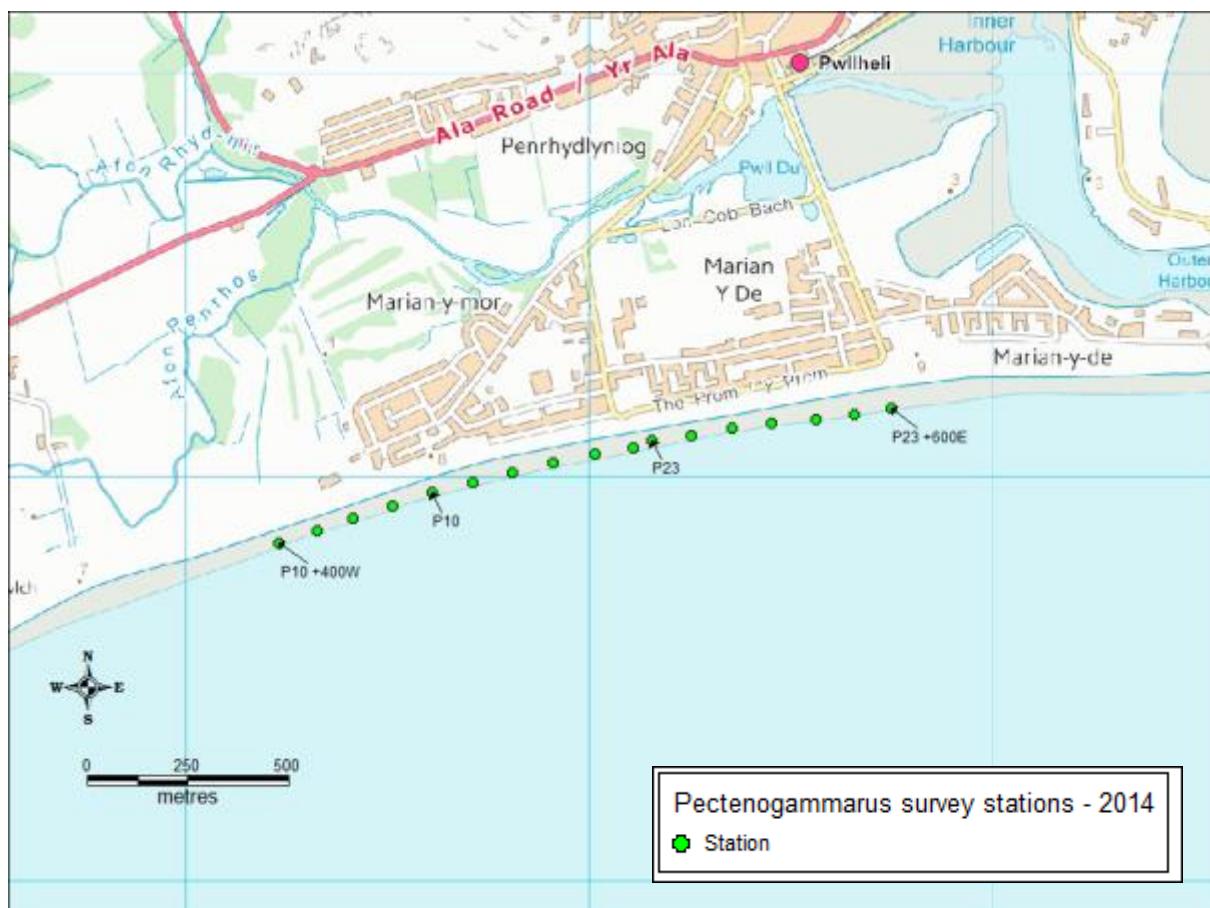

Figure 4 *Pectenogammarus planicrurus* sampling locations in 2014. © Crown Copyright and database right 2016. Ordnance Survey. Licence number 100019741.

2.4 Quantitative and semi-quantitative sampling of the Glaslyn/Dwyryd sediments

Existing maps of the Glaslyn/Dwyryd sediment flats (GIS data from CCW Phase 1 survey) were used to re-visit 9 quantitative intertidal, infaunal core sites and 25 *in situ* sediment monitoring grid sites. All 34 sites were first selected in 2008 when a set of 90+ *in-situ* grid stations were created in a GIS project. The 34 sediment monitoring sites sampled on Wednesday 13th August 2014 are shown on Figure 5.

Three infaunal core samples were taken from each of the 9 quantitative sites using a 0.01 m² intertidal corer. At each site the cores were all taken within a radius of approximately 5 m from the central grid point mark; and randomly placed without reference to the surface features (with eyes closed). Each core was then sieved *in situ* over a 0.5 mm mesh and the sieve contents were transferred to a suitably labelled pot or plastic bag. These samples were later taken back to the survey base and preserved in 10% formalin.

A sample of the sediment was also taken from each of these stations for granulometric analysis. The sample was usually taken from the side of one of the corer holes, to a depth of at least 5 cm, labelled and double bagged.

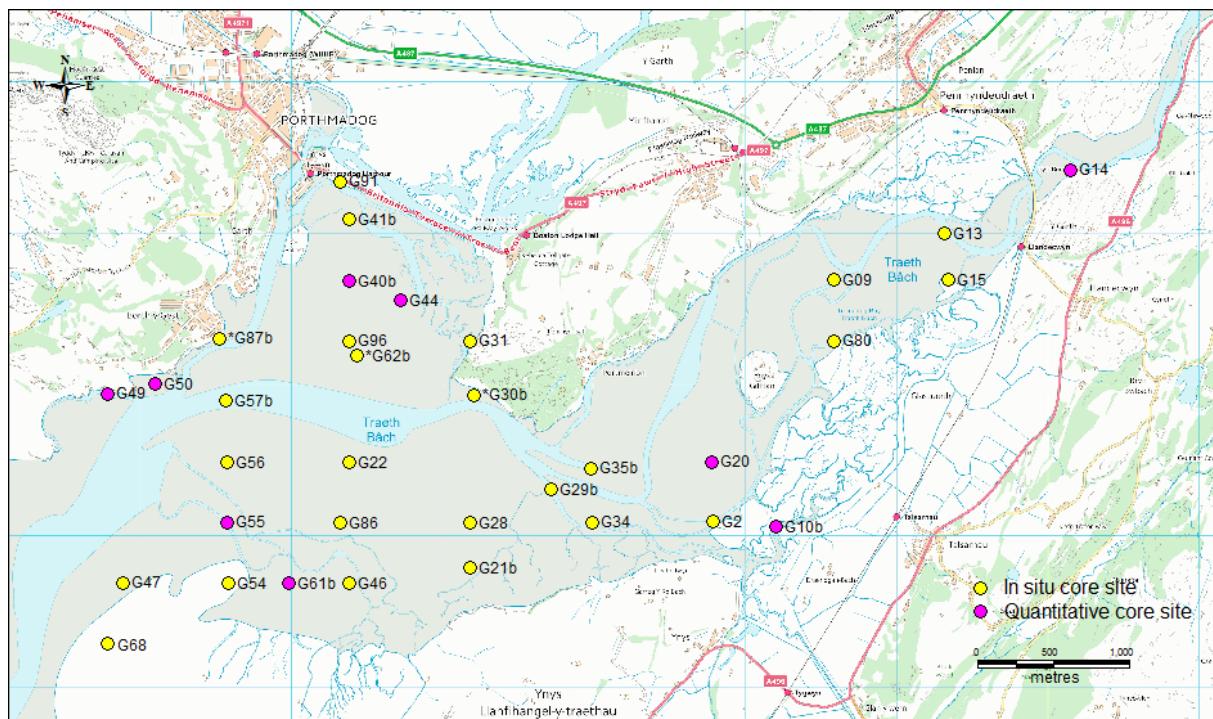

Figure 5 Quantitative coring stations on the Glaslyn /Dwyrdd in 2014. Yellow – *in situ* recording, purple – repeat replicate, full infaunal analysis. © Crown Copyright and database right 2016. Ordnance Survey. Licence number 100019741.

The samples for macrofauna and granulometry analyses were later taken to the NRW offices at the end of the survey for later transfer to a macrobenthic analytical laboratory to be processed under a separate framework contract.

The reduced tranche of 23 grid sites were uploaded into Garmin GPS units, which were then used in conjunction with coloured, waterproof aerial photographs of the estuary, in order to locate each of the stations.

On site, three survey teams each navigated to a selection of stations and carried out an *in situ* assessment of the sediment biotope.

Records of conspicuous species and surface sediment features were made from each station within a circle of 1m radius around the central core sample position. Key features to record were:

- Sediment description, with the aid of a grain size comparator and magnifying glass (e.g. well sorted Medium Sand, muddy very fine Sand, gravelly medium Sand, fine Sand / very fine Sand).
- Sediment softness - on a scale of 1 to 5 (1 = very hard / rock, 5 = ankle depth or more).
- Depth (cm) of black layer (redox potential discontinuity layer)
- Abundance of common epifaunal and floral taxa e.g. *Arenicola* casts and Green algae.
- Abundance of common infaunal taxa e.g. cockles, ragworm and amphipod shrimps.

These assessments were made in part from the single 0.01 m² core sample that was taken at each survey station unless the station happened to lie on a rocky outcrop, in a drainage channel or in a pool greater than ~5 cm deep.

The core sample was sieved through a 0.5 mm mesh sieve in a nearby pool and the sieve contents were inspected closely with the aid of a magnifying glass. As far as possible all visible animals were identified and counted by the surveyor with the most infaunal taxonomic experience in the pair. A simple photographic guide to the most common species/taxa present was carried by each pair of surveyors as an aide memoire. Specimens of animals that a surveyor could not recognise, but which were frequent and were distinctly marked or shaped, were collected for later inspection under microscopes at the survey base. The names and counts of all conspicuous species/taxa were recorded on a waterproof paper recording form. A copy of this form is presented in Appendix 2, whilst the full quantitative core site's results are also presented in Appendix 5.

The quality and thoroughness of the species records and counts appeared generally high, but it was unavoidably reduced when large amounts of coarse sediment, such as bivalve shell material, or allochthonous organic material was present within the sediment.

Any other conspicuous species seen were recorded, usually with estimates of their abundance. A suite of other notable physical features were also recorded and photographs were taken to illustrate the substrata and habitat features.

2.5 Porth Oer rocky shore quadrat surveys

During low tide on 10th and 12th of August 2014, the Porth Oer shore was visited by the field team and the 12 permanent quadrats were relocated, photographed and surveyed. Each quadrat's locating screws were found using the 'relocation photographs' within each shore zone (see Mercer (2013) for relocation details). The quadrats were originally sited in homogeneous areas of inclined rock, avoiding rock pools and large fissures where possible. The data were recorded on a form modified from Boyes *et al.* (2008). This form and its instructions are presented in Appendix 2, whilst the full quadrat results are presented in Appendix 8.

2.5.1 Permanent Quadrat Recording (cell counts)

Within each 1 m² quadrat presence/absence data were recorded for all conspicuous species using a 25 cell grid (i.e. 20 cm x 20 cm cells). This gave a frequency score of between 0 and 25 for each species. Organisms were identified to species level where possible with specimens, collected from outside the quadrat, being returned to the laboratory for verification where necessary. Species within the following taxa were aggregated for cell counts: barnacles, limpets, flat winkles, rough winkles, amphipods, *Verrucaria* spp (except *Verrucaria mucosa*).

Only algae whose stipes were within the quadrat were counted. This requires algae growing outside the quadrat to be separated to facilitate an accurate measure of abundance. Epiphytes on macroalgae were recorded from the cell in which the macro-alga was attached. Care was taken to minimize disturbance of mobile invertebrates when macro-algal species were moved.

2.5.2 Limpet Counts

Limpet abundance (all species aggregated) was recorded from 5 random 20 cm x 20 cm cells within each quadrat to allow the estimation of mean limpet abundance for all three zones at the survey site.

2.5.3 Limpet Monitoring

Up to 200 limpets (minimum 100) were systematically selected within the middle shore zone. All limpets encountered were measured to ensure a representative population sample was collected without bias. The longest basal shell length was measured in mm using vernier callipers. These data are used to construct a population profile for the site in Section 3.5.3.

2.5.4 Barnacle Abundance

Percentage cover of barnacles (all species aggregated) was recorded from 5 random 20 cm x 20 cm cells within each quadrat to allow the estimation of mean barnacle abundance for all three zones at the survey site.

2.6 Mawddach estuary sediment sampling

Existing maps of the Mawddach estuary sediment flats and GIS data from NRW were used to relocate three, permanent, sediment, infaunal monitoring transects on Tuesday 12th August 2014.

Four infaunal community sampling transects were set up in 1999 that run out from the high water mark towards low water in the middle of the Mawddach estuary. These transects run across the sediment flats. There are two originating from the south shore and two from the north shore and originally the sediment beyond the lower saltmarsh was sampled at 25 m intervals, to the lower water mark. The locations, bearings and transits of the transects are shown in table 5 below. Only Transects 1-3 were sampled in 2014 and these only selectively, sampling in mud, muddy-sand and sand if these facies were present. Three stations were sampled on transects 1 and 2 and four stations were sampled on transect 3, as shown in Figure 6.

Table 5 Mawddach sediments - infaunal monitoring transects

Transect number and relative location	Bearing	Stake origin. (OSGB)	End point (OSGB)	Transit description from the origin stake.	Additional marks
1 (South western)	308°	265333 (E) 316404 (N)	264958 (E) 316540 (N)	White house on the Barmouth road with the central chimney.	White paint on rock
2 (South eastern)	274°	265632 (E) 316767 (N)	264897 (E) 316882 (N)	White house on the Barmouth road with the central chimney.	White paint on rock
3 (North western)	145°	264120 (E) 317202 (N)	264729 (E) 316620 (N)	The 4 windowed, gable ended house at Garth Isaf.	White paint on rock
4 (North eastern)	140°	264276 (E) 317242 (N)	264691 (E) 316936 (N)	Outcrop of rock forming the origin of Transect 1 (east of Garth Isaf).	White paint on the stone embankment

The transects were located using GPS receivers and a reduced set of stations were sampled by coring. Descriptions of the transects and summary results are presented in section 3.

At each station, the sediments were described and photographed and a batch of 3 x 0.01 m² core samples and a granulometry sample were collected from each station. All cores were taken from within a circle of radius 5 m. These cores were sieved in the field over a 0.5 mm mesh and later, back at the survey base, the residues were fixed with 10% formaldehyde solution. The nature of the infaunal community found in these sediment cores was deduced through laboratory analysis by Hebog Environmental Ltd. following the conclusion of the field survey. Results of the laboratory analyses and the field description survey are described in Section 3.6, discussed in section 4 and presented in their raw form in Appendix 6.

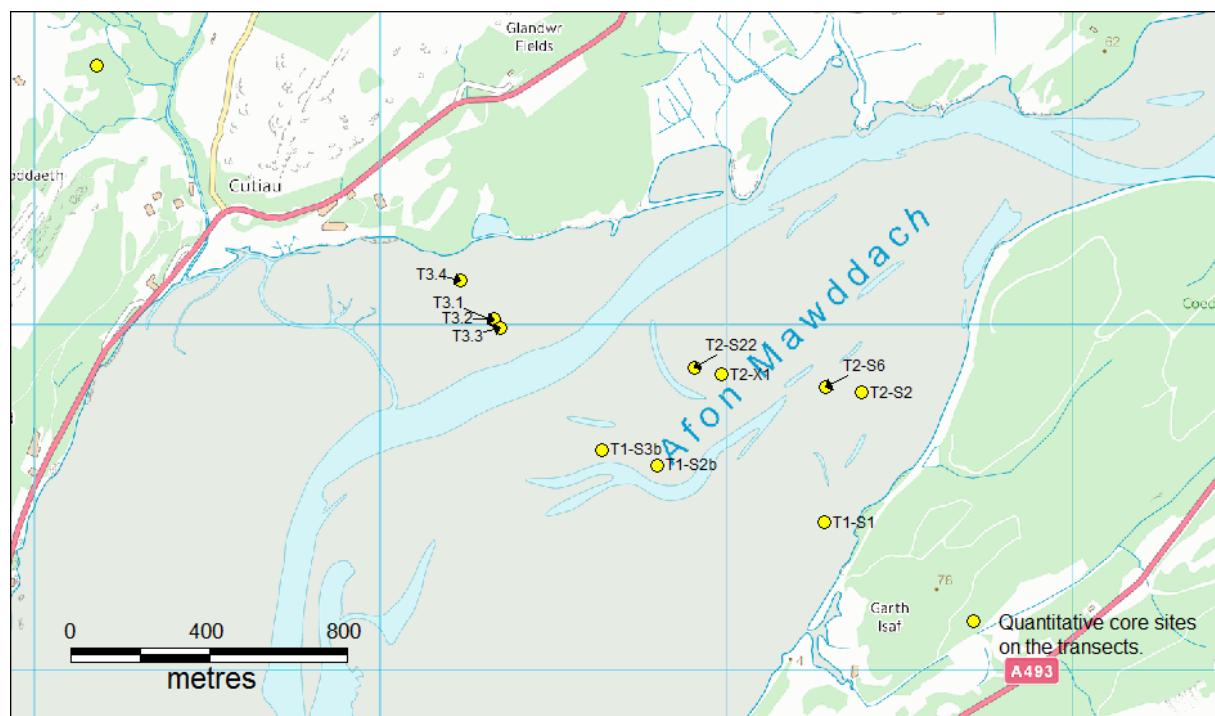

Figure 6 Mawddach Estuary sediment sampling sites in 2014. © Crown Copyright and database right 2016. Ordnance Survey. Licence number 100019741.

2.7 Open coast sampling

In addition to the estuary surveys, core samples were taken from 4 selected open coast beach sites for both standard laboratory analysis of the macrobenthic infaunal biotope and for the sediment granulometry. The four locations were on beaches previously sampled in Tremadog Bay in 2009. They were selected by NRW in order to provide a geographical spread to the sampling. The surveyors navigated to the stations at low water on the early morning low tide of 14th August, using the hand-held GPS units from the relevant car parks. Table 6 presents the locations of the open coast infaunal core sampling. At each site, the sediment was described and photographed, a sediment particle size distribution sample was taken and then 5 x 0.01 m² infaunal cores (depth 150 mm) were collected and sieved over a 0.5 mm mesh. Samples were then returned to base where they were catalogued, fixed and labelled.

Table 6 Open coast sampling locations in Tremadog Bay, 14/08/2014.

Site	Surv-eyor	Description	Long	Lat	East	North

Black Rock Sands	TM/CH	Mid shore 5 x 0.01 m ² cores	-4.18311	52.9077	253285	336710

Results of the macrobenthic infaunal analysis performed by Hebog Environmental are presented in Appendix 7.

2.8 Photography

Photographs were taken with the following cameras:

Panasonic Lumix digital camera. These jpg files have the prefix 'TM'.

Canon Eos. These jpg files have the prefix 'CMH'

Fujifilm XP. These jpg files have the prefix 'LK'

Cannon D10 digital camera. These jpg files have the prefix 'BW', 'MD' and 'LK'.

All the .jpg photograph files were renamed according to the following convention:

Date (year month day) underscore, Photographers Initials (up to 5 letters) underscore Site / Station underscore and photograph number underscore 'Any-other-useful-info'.

e.g. 20140811_TSM_Llandanwg_L2_0013.JPG

The photographs are catalogued in the relevant spreadsheet data files, including a hyperlink that allows the photographs to be opened directly from the Excel file (when stored in the appropriate sub-directory). The photograph catalogue is included as Appendix 4.

2.9 Data collation, analysis and mapping

All data were entered into Microsoft Excel spreadsheet files during the course of the survey, usually by the individual surveyors who had collected it. Species names are according to Howson and Picton (1997), except for the lichens which are according to Dobson and Dalby (1997). A series of checks were then made to ensure that all the data were in appropriate formats with no errors.

Raw data were stored in the following files:

PLAS_14_Rockyshore_Porth_Oer_Data.xls
PLAS_14_Sabellaria_Station_Data.xls
PLAS_13_Glaslyn_Dwyryd_sediment_Data
PLAS_14_Mawddach_sediment_Data
PLAS_14_PhotoLog.xls

The site location positions and survey tracks were also downloaded from the handheld GPS receiver units on a daily basis. The daily GPS downloads were converted to *MapInfo Tab* files and then displayed in GIS for data collation and map production. All relevant species and habitat data have been entered into Marine Recorder.

3 Results

Field work was carried out during the five days of spring tides. A team of four experienced marine biological surveyors from ASML and NRW took part in the day to day surveys. The core team of Tom Mercer, Christine Howson, Lucy Kay and Ben Wray were ably assisted by Tim Dixon, the field assistant from ASML and Molly Duggan, a very capable 'Sandwich Student' from NRW. Figure 1 shows the locations of the survey areas. Appendix 3 to 8 tabulates the recorded field data and Appendix 9 catalogues the photographs taken.

3.1 *Sabellaria* data

Figures 2 and 3 show the locations and numbers of the survey transects and quadrat stations at Llandanwg and West of Afon Dwyfor respectively. Tables 7, 8 and 9 summarise and compare the data collected. The full data are tabulated in Appendix 3 and 4.

In order to compare the reef growth performance or indeed shrinkage year on year, the areas of *Sabellaria* reef at both Llandanwg and West Afon Dwyfor were mapped. At Llandanwg the area of the reef to the south of Transect 1 was calculated in 2012, 2013 and 2014. The same was done for the West of Afon Dwyfor reef between the transect at WAD8 and the NGR Easting line SH 247000. Table 7 presents these data.

Table 7 Comparisons between the 2012, 2013 and 2014 *Sabellaria* reef areas at Llandanwg and West Afon Dwyfor

Area (Ha)	2012	2013	2014	Change from 2013 to 2014
Llandanwg	1.795	2.371	1.826	-23.0%
West Afon Dwyfor	2.382	2.6702	0.8734	-67.3%

The areas of reef at both survey locations can be seen to have decreased between 2013 and 2014 indicating that the *Sabellaria* polychaetes were dramatically affected by the winter storms of 2013/2014, with the impact at West Afon Dwyfor being most marked.

Table 8 Conspicuous core taxa recorded within the *Sabellaria alveolata* quadrats at Llandanwg

Taxon	Data Type	Llandanwg 2012		Llandanwg 2013		Llandanwg 2014	
		% Frequency of occurrence	Mean % cover	% Frequency of occurrence	Mean % cover	% Frequency of occurrence	Mean % cover

<i>Fucus vesiculosus</i>	**%	76.0	37.7	82.0	27.4	62.5	21.3

Table 9 Conspicuous core taxa recorded within the *Sabellaria alveolata* quadrats at West Afon Dwyfor

Taxon	Data Type	West of Afon Dwyfor 2012		West of Afon Dwyfor 2013		West of Afon Dwyfor 2014	
		% Frequency of occurrence	Mean % cover	% Frequency of occurrence	Mean % cover	% Frequency of occurrence	Mean % cover
<i>Sabellaria alveolata</i> (total)	T%	43.0	6.7	38.0	4.4	31.4	4.8
<i>Sabellaria alveolata</i> (live)	%	33.0	1.5	30.0	2.0	13.3	1.2
Cirripedia (total)	*T%	70.0	0.2	89.0	0.9	85.7	0.7
<i>Mytilus edulis</i>	*P	7.0	0.0	0.0	0.0	0.0	0.0
Algae (total)	*T%	97.0	58.0	100.0	60.7	91.4	35.0
Chlorophycota	*T%	33.0	0.3	40.0	1.4	14.3	0.3
<i>Fucus serratus</i>	**%	57.0	14.3	97.0	49.7	42.9	7.6
<i>Fucus vesiculosus</i>	**%	93.0	43.5	40.0	1.4	88.6	26.0

The tables above show that both the frequency of occurrence and mean percentage cover of *Sabellaria* reef area at Llandanwg were reduced within the bed. This was also the case at West Afon Dwyfor.

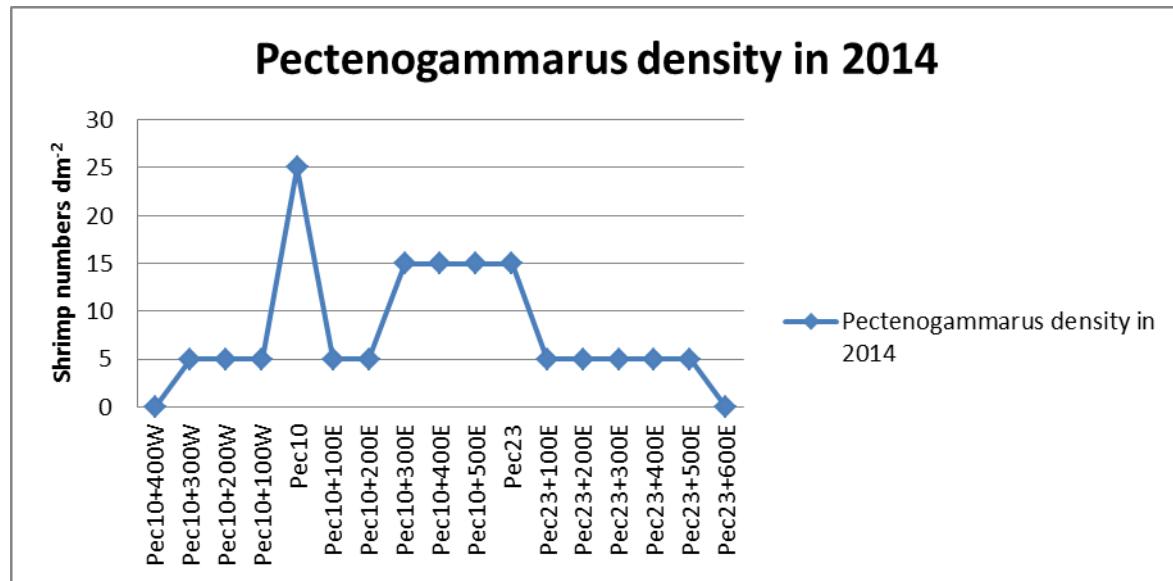

At Llandanwg all dominant taxa were reduced in abundance, with the exception of Cirripedia, which increased. This may have been due to increased juveniles colonising newly created space following the storms. Whilst at West Afon Dwyfor, the dominant taxa also tended to reduce, with the exception of *Fucus vesiculosus*, which apparently increased considerably and *F. serratus* which decreased considerably.

3.2 *Pectenogammarus* at Marian-y-de

Seventeen stations on the shingle beach at Pwllheli were surveyed for the presence of the amphipod *Pectenogammarus planicrurus* (Stations are shown on Figure 4). Numerous individuals were found within the shingle scrapes as presented in Table 10 and shown on Figure 7.

Table 10 Abundance of *Pectenogammarus planicrurus* in the shingle.

Figure 7 Density of *Pectenogammarus planicrurus* across the shore at Marian-Y-De in 2014

The results show that *Pectenogammarus planicrurus* is fairly evenly distributed across the coarse sand and shingle shore within the suitable habitat at Pwllheli and numbers remain at a healthy level.

3.3 Quantitative sampling of the Glaslyn/Dwyryd estuarine sediments

The 27 samples collected from the 9 core sites re-visited in 2014, were sent for taxonomic analysis to an NMBAQC laboratory. The results of this taxonomic analysis are presented in Appendix 5. Once the data were 'cleaned' - removing juveniles, damaged specimens and amalgamating taxa such as *Hediste diversicolor* with Nereididae, the results were run through PRIMER 6 (Plymouth Routines In Multivariate Ecological Research). This statistical analysis package consists

primarily of a wide range of univariate, graphical and multivariate routines for analysing arrays of species-by-samples data to investigate the community ecology.

Table 11 Mean univariate statistics for the replicate infaunal core data from the Glaslyn/Dwyryd in 2013 and 2014

Station	S		N		d		J'		H'(log _e)		1-Lambda'	
	2013	2014	2013	2014	2013	2014	2013	2014	2013	2014	2013	2014
G 10b	6	3	34	5	1.45	1.76	0.73	0.98	1.27	0.80	0.68	0.95
G 14	2	1	2	2	0.78	1.24	0.62	0.86	0.56	0.32	0.50	0.70
G 20	8	6	123	32	1.38	1.48	0.51	0.68	1.04	1.19	0.48	0.60
G 40	3	3	4	4	0.93	1.40	0.60	0.94	0.74	0.73	0.51	0.73
G 44	7	12	45	282	1.59	1.90	0.78	0.51	1.51	1.22	0.76	0.62
G 49	5	8	9	123	1.98	1.45	0.92	0.35	1.48	0.72	0.85	0.30
G 50	2	3	32	4	0.38	1.76	0.40	0.99	0.30	1.14	0.16	0.96
G 55	1	3	1	7	-	1.31	-	0.90	-	0.81	-	0.75
G 61	6	8	67	97	1.11	1.61	0.70	0.55	1.17	1.17	0.60	0.52

- S – Mean taxa
- N – Mean total individuals: The mean number of individuals per core from all three cores per site.
- d – Mean Margalef's richness for all three cores per site. $(S-1)/\ln(N)$ - it is a measure of the number of taxa present, making some allowance for the number of individuals.
- J' – Mean Pielou's evenness from all three cores per site - this is a measure of equitability, a measure of how evenly the individuals are distributed among the different taxa.
- H'(log_e) – Mean Shannon-Wiener diversity index from all three cores per site
- 1-Lambda' - Mean Simpson's diversity index from all three cores per site

Table 11 shows that the greatest numbers of taxa, individuals, Richness and Shannon-Weiner diversity were found at G44, in mid-estuary and in the middle shore on the Glaslyn, seaward of the railway bund. However both Pielou's Evenness and Simpson's diversity were highest at G50 and G10b, in both the mouth and the mid-estuary saltmarsh of the Glaslyn / Dwyryd system. Both these sites were characterised by very few taxa and individuals.

The particle size distribution analysis for these samples is shown in Table 12 and confirms all samples to be dominated by fine and very fine sands, with significant proportions of mud found only at G44 and G61.

Table 12 Particle size distribution - percentage fractional data

3.4 Semi-quantitative survey of the Glaslyn Dwyryd sediments' conspicuous species and sediment features by in situ assessment.

The *in situ* sediment core, habitat and community assessment results are presented in Table 13 below. The results present a picture of a typical, fine-sand and muddy-sand estuary with a low diversity infaunal community.

Conspicuous species present, noted on and in the surface of the sands, included the species listed below:-

- Arenicola marina*
- Cerastoderma edule* adults
- Cerastoderma edule* juveniles
- Epipsammic diatoms
- Corophium* species
- Peringia ulvae*
- Scrobicularia plana*
- Fucus vesiculosus*
- Ulva* species

Table 13 presents the conspicuous species noted in the contents of the sieved *in situ* cores. Red figures are those dominant organisms observed on the surface of the sediments, but not noted in the core residues. With these combined data, tentative biotopes are presented. In general the estuaries are dominated by relatively depauperate fine sand communities of invertebrates.

3.5 Porth Oer Rocky shore quadrats

The 12 rocky shore quadrats were surveyed and photographed on 10th and 12th August 2014 and the results which are summarised below are fully presented in Appendix 8.

3.5.1 Littoral taxa abundance data

The 56 taxa that were recorded in the quadrats are summarised in Table 14. In 2013, 51 taxa were recorded.

Table 14 Species/taxa recorded in the fixed quadrats at Porth Oer in August 2014

3.5.2 Limpet density count data

Table 15 Random limpet counts and their densities in the fixed quadrats at Porth Oer 2014

Year	2014				2014				2014			
	Upper shore				Middle shore				Lower shore			
Quadrat	1	2	3	4	1	2	3	4	1	2	3	4
1	0	0	0	0	7	6	4	8	14	12	15	13
	0	0	0	0	18	9	6	8	14	20	14	21
	0	0	0	0	8	9	5	5	16	24	15	5
	0	1	0	2	14	10	4	9	10	13	18	25
	0	1	4	3	9	12	9	7	9	22	13	19
Mean no. (m ⁻²)	13.75				208.75				390			
% change from 2013	-62.07%				+3.73%				-8.50%			

Table 15 shows how the limpet population changed between 2013 and 2014 in the fixed quadrats at Porth Oer. Both the upper and lower shores showed a significant decrease in limpet density, but the middle shore showed a slight increase.

3.5.3 Middle shore limpet population data

Table 16 Maximum length measurements of 100+ randomly selected limpets on the middle shore

2014 limpet spp. size data for the Porth Oer mid shore												
17	18	23	19	21	23	25	29	19	21	23		
22	14	13	13	21	24	30	24	13	18	26		
26	17	18	25	19	25	20	16	32	19	20

19	16	17	15	22	18	26	20	25	22	24		
16	16	21	17	22	18	24	18	25	26			
18	23	20	28	20	15	17	24	19	29			
17	24	23	25	34	20	23	20	30	23			
27	15	19	34	16	18	21	23	16	20			
17	15	14	28	18	16	12	26	24	22			
2014 Mean limpet size = 20.9 mm (n=105)						Change from 2013 = +1.5%						
2013 Mean limpet size = 20.6 mm (n=120)												

Table 16 shows a very slight increase in mean size of limpet between 2013 and 2014 in the middle shore, a fact illustrated by the histograms presented in Figure 8 which illustrates a loss of smaller limpets in the cohort.

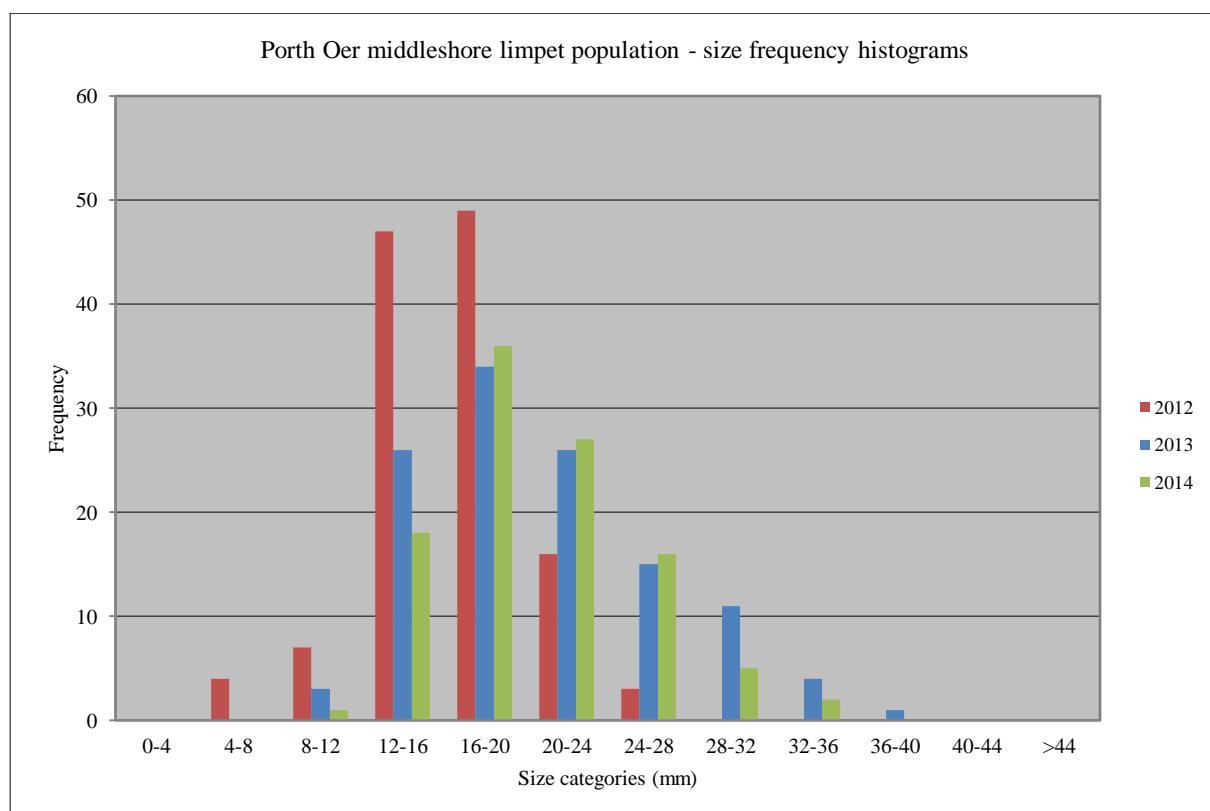

Figure 8 Size frequency histograms for the middle shore limpet population at Porth Oer

3.5.4 Cirripedia population abundance data

Table 17 Percentage cover of all barnacle species in 5 random cells within the fixed quadrats

Year	2014				2014				2014			
Zone	Upper shore				Middle shore				Lower shore			
Quadrat	1	2	3	4	1	2	3	4	1	2	3	4
1	0	0	0	0	30	80	50	50	10	25	45	40
2	0	0	0	0	20	90	45	50	15	10	60	60
3	0	0	0	0	25	70	50	50	15	25	45	20
4	0	0.25	0.25	0.25	30	60	40	60	15	10	45	60
5	0	0.25	0	0.25	60	70	55	45	20	20	25	70
Mean %. (m ⁻²)	0.06%				51.5%				31.75			
% change from 2013	-37.5%				-14.9%				-15.1%			

Table 17 shows a decrease in population density of the barnacle species in the upper, middle and lower shore, with the largest percentage fall being shown in the upper shore in a similar pattern to the limpet population.

3.6 Mawddach sediments

3.6.1 Quantitative sampling of the Mawddach estuary sediments

Thirty three samples were collected from 11 core sites on monitoring transects 1, 2 and 3 in the Mawddach estuary in 2014. These sites were last sampled in 2012. The sieved core residues were sent for taxonomic analysis to an NMBAQC laboratory. The results of this taxonomic analysis are presented in Appendix 6. Once the data were 'cleaned' - removing juveniles, damaged specimens and amalgamating taxa such as *Hediste diversicolor* with Nereididae, the results were run through PRIMER 6 (Plymouth Routines In Multivariate Ecological Research). This statistical analysis package consists primarily of a wide range of univariate, graphical and multivariate routines for analysing arrays of species-by-samples data to investigate the relationships within the infaunal community ecology.

- S – Mean taxa.
- N – Mean total individuals: The mean number of individuals per core from all three cores per site.
- d – Mean Margalef's richness for all three cores per site. $(S-1)/\log(N)$ - it is a measure of the number of taxa present, making some allowance for the number of individuals.
- J' – Mean Pielou's evenness from all three cores per site - this is a measure of equitability, a measure of how evenly the individuals are distributed among the different taxa.
- H'(log_e) – Mean Shannon-Wiener diversity index from all three cores per site.
- 1-Lambda' - Mean Simpson's diversity index from all three cores per site.

The particle size distribution analysis for these samples is shown in Table 19. The data confirm that the sampling locations along the transects running from mud at the upper sites, adjacent to the salt marshes, through muddy-sand to sand adjacent to the river channels.

Table 19 Particle size distributions expressed as percentage fractional data from an analysis by dry sieving. Sediment samples from the Mawddach infaunal monitoring transects.

Table 18 which compares the infaunal univariate community statistics for the transect stations in 2012 and 2014 generally shows no pattern. The major point of observation to be made is that the abundance of infauna in 2014, tended to be lower at most stations, than in 2012 and as the number of taxa were relatively stable, consequently the diversity indices (H' and 1-Lamda) are higher in 2014 than in 2012.

Table 20 presents the mean infaunal data calculated from the 3 cores taken at each station. Tentative biotopes have been allocated to these community data and are also presented. The muds and muddy sands tend to be dominated by sparse ragworm, spionid polychaetes, oligochaetes, gastropods *Peringia ulvae* and bivalves *Scrobicularia plana*, whilst the mobile sands of the lower shore stations are relatively barren, being exposed to constantly fluctuating salinity, mobile sediments and strong water movements on a daily basis.

Table 20 Biotope assessment based on the infaunal taxa found in the Mawddach monitoring transect cores

Taxa \ Station	T1-1	T1-2	T1-3	T2-1	T2-2	T2-6	T2-22	T3-1	T3-2	T3-3	T3-4

T3-3	LMS.Pcer	LS.LSa.FiSa.Po	LS.LSa.MoSa.OI.VS	Sandy / river channel?
T3-4	LMS.Pcer / LMS.MacAre	(LS.LMu.MEst.HedMacScr)	LS.LMu.MEst.HedMacScr	Muddier character
T4-1	LMU.HedScr	LS.LMu.UEst.Hed.Cvol	-	Muddier character

The granulometric data for transects 1 and 2 show an increased portion of mud content (T1 = 5%, T2 = 10% on average), with a proportionate reduction in coarse and medium sand fractions. At transect 3, on the other (north) side of the estuary, the reverse is true, with on average 5% less mud present. This reflects the current nature of the estuary channel, which has been erosive on the north side and depositional on the south side of the estuary at this location.

3.7 Open coast sampling

The open coast samples were analysed by an NMBAQC laboratory. The results are shown in Appendix 7.

Table 22 Mean univariate statistics for the replicate infaunal core data from the open coast

Location	Station	S	N	d	J'	H'(log e)	1-Lambda'
Morfa Dyffryn	MD-LS	4	5	1.75	0.96	1.22	0.89

East Criccieth	EC-LS	10	42	2.36	0.80	1.80	0.79
Black Rock Sands	BRS-LS	6	9	2.17	0.94	1.61	0.88
Black Rock Sands	BRS-MS	3	14	0.79	0.67	0.71	0.47

- S – Mean taxa.
- N – Mean total individuals: The mean number of individuals per core from all three cores per site.
- d – Mean Margalef's richness for all three cores per site. $(S-1)/\log(N)$ - it is a measure of the number of taxa present, making some allowance for the number of individuals.
- J' – Mean Pielou's evenness from all three cores per site - this is a measure of equitability, a measure of how evenly the individuals are distributed among the different taxa.
- H'(log e) – Mean Shannon-Wiener diversity index from all three cores per site.
- 1-Lambda' - Mean Simpson's diversity index from all three cores per site.

4 Discussion

- In 2014 the areas of *Sabellaria alveolata* reef at both survey locations, Llandanwg and West of Afon Dwyfor can be seen to have decreased dramatically, having apparently been affected by the winter storms of 2013/2014. The impact at West Afon Dwyfor was the most marked with a decrease in reef area of 67%. The pattern within the associated species was also one of decreasing abundance.
- *Pectenogammarus planicrurus* at Marian-Y-De were found in relatively healthy numbers within the extensive zone monitored.
- The Glaslyn/Dwyryd infaunal cores again revealed a low diversity infaunal invertebrate community, with the greatest number of taxa and individuals this year in the mid-estuary and mouth of the Glaslyn. This community was unsurprisingly still dominated by bivalves, amphipods and spionids.
- No dramatic changes were identified in the univariate data calculated for the infaunal communities at the mid and upper estuary monitoring stations. Some characteristics fluctuated at the mouth where the sediment is regularly mobilised and regular changes in the community structure are to be expected.
- At Porth Oer, a similar number of taxa were encountered in the quadrats in 2014 as in 2013 (56 compared to 51).
- The limpet population at Porth Oer had changed slightly in 2014, with a dramatic decrease in density in the upper shore, a feature possibly again

attributable to the storms of the previous winter. The middle and lower shores apparently remaining relatively stable. There was also a slight increase in limpet size in the middle shore.

- Barnacle cover at all three shore heights showed a 15-40% decrease, possibly reinforcing the storm impact theory.
- The monitoring transects on the Mawddach show that the muds and muddy sands tend to be dominated by sparse ragworm, spionid polychaetes, oligochaetes, *Peringia ulvae* and *Scrobicularia plana*, whilst the mobile sands of the lower shore stations are relatively barren, being exposed to constantly fluctuating salinity and strong water movements on a daily basis. There appear to be no significant differences in the infaunal univariate statistics noted between the sampling occasions of 2012 and 2014.

Consideration of the changes in biotopes over time, based on analysis of the infauna, suggest that there is a shift, in general, to biotopes characterised by mud preferring species. In 2012, there was a greater density of *Corophium* which influenced the biotopes assigned. Some stations clearly go through dramatic changes, where river channels or sand bars shift. It is recommended that, if there are ephemeral features at the relocated station, a more representative sampling station is used by moving to one side of the feature, trying to keep to the same shore height.

The importance of balancing sample stations on both sides of the estuary is evident in the data, that show the differing nature of the environment on the north and south sides.

- The results from the sediment infaunal analyses would benefit from further trend analysis over the years that they have been sampled. This would provide a better single baseline against which to measure future records from the estuaries and the open coast.
- The results of the rocky reef can be difficult to interpret from a single visit per year, due to short term changes such as in Cirripedia density not being taken into account. The use of 5 year rolling means may prove a useful analysis to smooth out inter-annual variability. This would allow recognition of major shifts in community type over time.

Appendix 1 Field Log: Field Diary NRW PLAS Survey August 2014

Saturday, August 9th 2014

Travel to Prenteg, Gwynedd; Survey base Ty Glaslyn; Prenteg

Personnel: TM: Tom Mercer (ASML), CH: Christine Howson (ASML), TD: Tim Dixon (Edinburgh University), BR: Ben Wray (NRW), LK: Lucy Kay (NRW), MD: Mollie Duggan (NRW).

Sunday, August 10, 2014

Low Tide: 3:45 PM GMTDT 0.8m

Squally and wet.

Pectenogammarus surveys at Pwllheli; *Sabellaria* at West Afon Dwyfor and the rocky shore at Porth Oer.

TM unpacks gear and shops for the survey.

All team assemble at Ty Glaslyn at 10.00.

Survey briefing over coffee, then prepare for *Sabellaria* surveys at West Afon Dwyfor (WAD), *Pectenogammarus* survey at Pwllheli and rocky shore survey at Porth Oer (PO). 1230 and 1300 Teams depart. BW, LK and MD work on *Sabellaria* at WAD. TM, TD, AB and CH go to Marian- y-De, where the team carry out a *Pectenogammarus* survey at PE10 and 23 and at 100m intervals both between and beyond PE23 to the east for 500m.

Then the team travelled on to Porth Oer Rocky Shore. Weather squally and both major surveys have to be abandoned and remained unfinished on the day due to foul weather and the risk of dangerous waves on the rocky shore.

1600 Team returns home and work up photos and data.

1900 ASML and AB eat at the Union Inn – Tremadog

2030 ASML and AB return to Ty Glaslyn and continue with data processing.

Monday, August 11, 2014

Low Tide: 4:37 PM GMTDT 0.7

Bright and sunny and windy.

Surveys of *Sabellaria* quadrats at Llandanwg and West Afon Dwyfor and further *Pectenogammarus* sites west of Pwllheli.

0700 TM sorts sheets, GPS and Cameras and packs ready for survey

1000 BW, LK and MD arrive at Ty Glaslyn to enter data from previous day.

1145 LK, BW and MD leave for Pwllheli to recommence *Pectenogammarus* surveys to the west of PE10, then back to WAD to finish *Sabellaria* survey.

1245 TM, TD, AB and CH, travel to Llandanwg to survey *Sabellaria*.

1800 Teams finish *Sabellaria* surveys and depart shore. NRW travelling staff return to Bangor, whilst AB and ASML return to Ty Glaslyn. ASML cook and eat in.

1930 ASML and AB begin evening work-up of algal data, specimens and photographs from the *Sabellaria* quadrats

2310 TD and CH retire, closely followed by AB.
2350 TM retires to bed

Tuesday, August 12, 2014

Low Tide: 5:24 PM GMTDT 0.5

Fine with a southerly wind.

Surveys of the sediment transects in the Mawddach Estuary and Porth Oer's rocky shore.

0630 TM up and sorts out datasheets and admin for the day
0930 NRW team arrives. Work on data input from Monday and sort work programs for the day.
1245 TM, TD, MD, BW and LK travel to Penmaenpool at the top of the Mawddach to meet Matt and Rees at 13.30. Following introductions and survey briefing:-
TM and TD survey north side T3 core sites. LK and MD survey T2 on the south side and BW, MG and RE survey T1, repositioning 2 sites due to channel movements.
1500 CH and AB travel to Porth Oer and complete the rocky shore quadrats, finishing at 18.35.
2000 All team eat at the Golden Fleece in Tremadog
2130 ASML team and AB begin evening work-up of algal data, specimens and photographs from the rocky shore quadrats
2300 TD and CH retire, closely followed by AB.
2400 TM retires to bed

Wednesday, August 13, 2014

Low Tide: 6:07 PM GMTDT 0.5

Initially wet with occasional drizzle then brightening up all day.

Sediment surveys on the Glaslyn /Dwyryd estuary

0715 TM gets up and fixes Mawddach infaunal core samples in full protective gear. Then TM sorts out recording sheets, data and admin for the day.
0930 NRW team arrives. All carry on photo labelling and entering data onto memory sticks. Work programs sorted for the day.
1345 TM and AB travel to Glan y Mor (Morfa Harlech) on the Dwyryd estuary and survey the south western part, covering 13 sites and taking in 2 quantitative core sites. TD and BW travel to the mouth of the estuary at Borth y Gest and Porthmadog and survey 10 sites, taking in 4 quantitative core sites, while LK and MD travel to Pont Briwet and survey the sites at the head of the estuary, taking in 3 core sites.
2000 All return to Ty Glaslyn and eat meal prepared by Christine who had missed the fieldwork with Laryngitis.
2130 ASML team and AB begin evening work-up, continuing with specimens and photographs from the rocky shore quadrats
2300 TD, CH and AB retire, closely followed TM

Thursday, August 14, 2014

Low Tide: 6:32 AM GMTDT 0.4

Fine and bright little wind

Surveys of the open coast sediments and the Dwyryd Estuary

0500 ASML Team and AB rise early and travel to open coast sites; AB and TD to Morfa Dyffryn and Morfa Harlech and TM and CH to East Criccieth and Blackrock Sands

Samples were taken from existing middle and lower shore sites, taking 5 cores and a grain size distribution sample at each.

0530 BW and MD travel to the north side of the Dwyryd estuary to finish the *in situ* core work; covering the remaining 4 sites.

1000 All teams arrive back at Ty Glaslyn and eat communal breakfast together –very civilized!

1100 TM labels and fixes all the remaining infaunal core samples taken, whilst the rest of the team spend the remainder of the day entering and QA 'ing the week's data.

1700 NRW (BW and MD) return to Bangor.

1900 ASML and AB eat at the Union Inn, Tremadog and then return to Ty Glaslyn to pack up the house.

Friday, August 15, 2014

Team disperses at 0745-0830. TM drives to Bangor to drop off infaunal samples with BW at the NRW offices, arriving at 0830. TM then heads off to Co. Durham. AB leaves Ty Glaslyn at 0900 for Pembrokeshire, as do CH and TD who travel up to Edinburgh.

20140810_MD_WAD_4149	MD	WAD		Sabellaria extent tracking			No Sabellaria present.
20140810_MD_WAD_4150	MD	WAD		Sabellaria extent tracking			No Sabellaria present - W042 marks the end of the sandy habitat and the beginning of the rocky/pebble habitat.
20140810_MD_WAD_4151	MD	WAD		Sabellaria extent tracking			No Sabellaria present - W042 marks the end of the sandy habitat and the beginning of the rocky/pebble habitat.
20140810_MD_WAD_4152	MD	WAD		Sabellaria extent tracking			Middle of the rocky/pebble habitat - no Sabellaria present.
20140810_MD_WAD_4153	MD	WAD		Sabellaria extent tracking			Middle of the rocky/pebble habitat - no Sabellaria present.
20140810_MD_WAD_4154	MD	WAD		Sabellaria extent tracking			Sabellaria present in small patches (<1m).
20140810_MD_WAD_4155	MD	WAD		Sabellaria extent tracking			End of small patches of Sabellaria.
20140810_MD_WAD_4156	MD	WAD		Sabellaria extent tracking			End of small patches of Sabellaria.
20140810_MD_WAD_4157	MD	WAD		Sabellaria extent tracking			Beginning of another sandy habitat.
20140810_MD_WAD_4158	MD	WAD		Sabellaria extent tracking			Beginning of another sandy habitat.
20140810_MD_WAD_4159	MD	WAD		Sabellaria extent tracking			Sabellaria present in small patches (<1m).
20140810_MD_WAD_4160	MD	WAD		Sabellaria extent tracking			Sabellaria present in small patches (<1m).
20140810_MD_WAD_4161	MD	WAD		Sabellaria extent tracking			Patchy Sabellaria, marking the end of the sandy habitat and the beginning of another rocky/pebble habitat.
20140810_MD_WAD_4162	MD	WAD		Sabellaria extent tracking			Patchy Sabellaria, marking the end of the sandy habitat and the beginning of another rocky/pebble habitat.
20140810_MD_WAD_4163	MD	WAD		Sabellaria extent tracking			End of the sandy habitat, and beginning of another rocky/pebble habitat - near the house (opposite end of Criccieth castle).
20140810_MD_WAD_4164	MD	WAD		Sabellaria extent tracking			End of the sandy habitat, and beginning of another rocky/pebble habitat - near the house (opposite end

Filename	Photo	Site	Transect	Zone	Stn	Replicate	Notes
20140810_MD_WAD_4165	MD	WAD		Sabellaria extent tracking			of Criccieth castle).
20140810_MD_WAD_4166	MD	WAD		Sabellaria extent tracking			End of the sandy habitat, and beginning of another rocky/pebble habitat - near the house (opposite end of Criccieth castle).
20140810_MD_WAD_4167	MD	WAD		Sabellaria extent tracking			End of the sandy habitat, and beginning of another rocky/pebble habitat - near the house (opposite end of Criccieth castle).
20140810_MD_WAD_4168	MD	WAD		Sabellaria extent tracking			100% standing water - no Sabellaria present.
20140810_MD_WAD_4169	MD	WAD		Sabellaria extent tracking			Sandy habitat - no Sabellaria present.
20140810_MD_WAD_4170	MD	WAD		Sabellaria extent tracking			End of the sandy habitat, and beginning of the rocky/pebble habitat.
20140810_MD_WAD_4171	MD	WAD		Sabellaria extent tracking			No Sabellaria present.
20140810_MD_WAD_4172	MD	WAD		Sabellaria extent tracking			End of the sandy habitat, and beginning of the rocky/pebble habitat.
20140810_MD_WAD_4173	MD	WAD		Sabellaria extent tracking			No Sabellaria present.
20140810_MD_WAD_4174	MD	WAD		Sabellaria extent tracking			No Sabellaria present - habitat is rocky with dense Fucus spp.
20140810_MD_WAD_4175	MD	WAD		Sabellaria extent tracking			No Sabellaria present - habitat is rocky with dense Fucus spp.
20140810_MD_WAD_4176	MD	WAD		Sabellaria extent tracking			End of rocky/pebble habitat, marking the beginning of the sandy habitat. No Sabellaria present up to this Waypoint.
20140810_MD_WAD_4177	MD	WAD		Sabellaria extent tracking			Patch of Sabellaria.
20140810_MD_WAD_4178	MD	WAD		Sabellaria extent tracking			Patch of Sabellaria.
20140810_MD_WAD_4179	MD	WAD		Sabellaria extent tracking			Patch of Sabellaria.
20140810_MD_WAD_4180	MD	WAD		Sabellaria extent tracking			Patch of Sabellaria.
20140810_MD_WAD_4181	MD	WAD		Sabellaria extent tracking			End of patchy distribution of Sabellaria, marking the beginning of the sandy habitat.
20140810_MD_WAD_4182	MD	WAD		Sabellaria extent tracking			Patchy distribution of Sabellaria.
20140810_MD_WAD_4183	MD	WAD		Sabellaria extent tracking			Patchy distribution of Sabellaria.
20140810_MD_WAD_4184	MD	WAD		Sabellaria extent tracking			Patchy distribution of Sabellaria.
20140810_MD_WAD_4185	MD	WAD		Sabellaria extent tracking			Evidence of previous Sabellaria reef - tending to be crusting and with few porches present which indicates live worms.
20140810_MD_WAD_4186	MD	WAD		Sabellaria extent tracking			Relatively isolated patch of Sabellaria.
							Relatively isolated patch of Sabellaria.
							Patch of Sabellaria (<1m).
							Patch of Sabellaria (<1m).

Appendix 10 Data Archive

Data outputs associated with this project are archived as Project No 41, Media No 1525 on server-based storage at Natural Resources Wales.

The data archive contains:

- [A] The final report in Microsoft Word and Adobe PDF formats.
- [B] A series of GIS layers on which the maps in the report are based with a series of word documents detailing the data processing and structure of the GIS layers
- [C] A series of spreadsheets named: PLAS 2014 Porth Oer bedrock Data.xls; PLAS 2014 Sabellaria Quads Data.xls; PLAS 2014 Glaslyn Dwyryd sediment Data; PLAS 2014 Mawddach sediment Data; PLAS 2014 open coast sediment Data; PLAS 2014 PhotoLog.xls in Microsoft Excel 2000 format with metadata.
- [D] A full set of images produced in jpg format.

Metadata for this project is publicly accessible through Natural Resources Wales' Library Catalogue <http://194.83.155.90/olibcqi> by searching 'Dataset Titles'. The metadata is held as record no [NRW to insert this number]
